Question 2

- 2-3-4 trees are balanced and can be searched in $O(\log n)$, but they have different node structures.
- To get 2-3-4 tree advantages in a binary tree format, we can represent it as a red-black tree.
- Convert the following 2-3-4 tree to a red-black tree

- **Properties of a red-black tree:**
 - the root is always black
 - **black condition:** every path from the root to a leaf node has the same number of black nodes
 - **red condition:** every red node has a black parent

Solution 2 (Cont.)

- **2-nodes:** can be represented with a **black** node

- **4-nodes:** center value becomes the parent (**black**) and the others become children (**red**)

Solution 2 (Cont.)

- 3-nodes:

- Note:

1. Red-black trees are not unique
2. However, the corresponding 2-3-4 tree is unique

Solution 2 (Cont.)

- Top-down conversion algorithm (start at the root):
 1. Apply red-black tree representation to each node
 2. Repeat for next level...
