Title of the paper:      Topics in biometric human-machine interaction security

Author(s):      Kannavara R., Shippy K.L.

Published in:      IEEE Potentials

**Brief summary of the paper**

This article is about biometrics, applications of biometric systems and security of these systems. Biometrics is the study of analyzing statistical biological data, such as health or emotion status of individuals by processing properties like gesture, voice, face pattern, odor, etc... There are many applications about biometrics, like speech recognition applications, medical applications. Working principle of these systems is based on collecting, controlling, storing the data. Therefore, there must exist some security precautions about these systems, depending on the thread models. Article explains these threads and security precautions, and also investigates future of these topics.

**Comments related to the paper**

In my opinion, biometric systems are promising, but these crucial security issues must be examined attentively, in the process of the development of this technology.
